# Gran Turismo 7

# “A Guide to Reproducing ‘Real Car Paint’ in GT7 using HSV Settings”

**Not GT7 or PS5 Endorsed**

**September, 2022**

## Purpose of this document

**Vehicle with original decal attached**

### Introduction

- This document has been prepared to assist Gran Turismo (GT7) Gamers to better utilise the GT Auto / Livery Editor features of GT7.
- The Livery Editor in GT7 allows gamers to:
  - place decals (such as *'Lou Grant'* shown left) on vehicles
  - add car components (e.g. a roll cage)
  - apply custom paint work to a vehicle.

**Patch placed over part of the decal**

### What is 'patching'?

- If an in-game or public-supplied decal is applied to a vehicle in the Livery Editor, then it may be desirable to place a 'patch' over part of the decal in order to achieve the desired outcome (e.g. change 'Lou Grant' to just 'Grant').
- After applying a default 'white' patch, it is normally desirable to alter the colour of the patch so that it matches the underlying vehicle paint.

**Adjust the colour HSV of the patch**

### Colour adjustment

- This document has been prepared specifically to help Gamers adjust the colour of such 'patches' so that they match a Real Car Paint that had previously been applied to the car.
- The HSV colour data provided in this document works best when applied to Solid colours (i.e. not metallic or pearl).
- It can be very difficult (if not impossible) to match the colour of metallic or pearl effect paints.

**Colour of the 'patch' matches the car**

### Metallic and Pearl tinted paints

- **Metallic paints** simulate the reflection of aluminium flakes, while **Pearl paints** simulate that addition of mica powder.
- The visual effects of *Metallic* and *Pearl* (mica) paints are partly computer-generated based on the direction of the light, and the shape of the bodywork.
- The visual effects of *Metallic* and *Pearl* paints cannot be reproduced solely through the HSV settings; however, this colour guide should help you to find an approximate colour match.

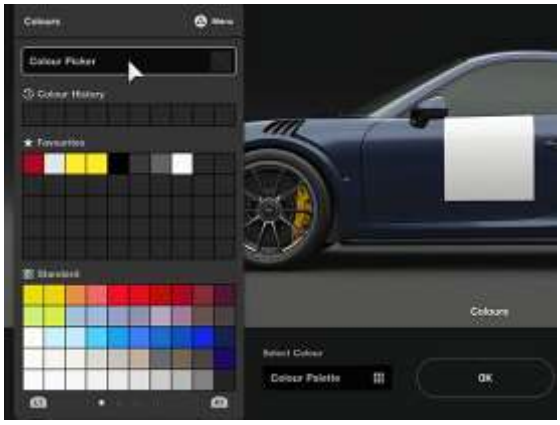
## Layout of this document

**Decals**

**Part 1: Introduction to the application of paints and decals**

Starts on page 4

- Introduction.
- Online Manual (explained).
- Applying colours to a car.
- Applying decals to a car.
- Downloading and storing decals.
- Modifying decals.



**Colour Picker**

**Part 2: Hints on adjusting HSV values on a decal or 'patch'**

Starts on page 13

- Hints on adjusting HSV values on a decal or 'patch'.
- Simulation of a textured/fabric/vinyl roof cover.
- Useful hints.

| | | Equivalent Solid Colour | | |
|---|---|---|---|---|
| Real Car Paint | Manufacturer | H | S | V |
| Abarth 1500 Biposto Bertone Grey | Abarth | 192 | 14 | 73 |
| Abarth 595 Essesse White | Abarth | 60 | 5 | 84 |
| Acid Blue | RUF | 217 | 79 | 89 |
| Active Green | Infiniti | 179 | 80 | 44 |
| Active Red | Nissan | 359 | 87 | 79 |
| Admiral Grey Metallic | Honda | 0 | 0 | 60 |
| Adrenaline Red | Dodge | 1 | 96 | 88 |
| Aetna Blau | Porsche | 216 | 37 | 35 |
| Agave | BMW | 175 | 81 | 35 |
| Alabaster Silver Metallic | Honda | 150 | 2 | 72 |
| Alfa Red | Alfa | 0 | 86 | 77 |
| Alfa White | Genesis | 60 | 2 | 84 |
| Almond Beige Metallic | Audi | 38 | 22 | 73 |
| Almond Green | Mini | 2 | 57 | 27 |
| Alpine Green Metallic | TVR | 45 | 16 | 75 |
| Alpine White | VW | 48 | 3 | 77 |
| Alpine White | Plymouth | 60 | 5 | 79 |
| Alpine White | BMW | 50 | 3 | 85 |
| Alpinweis | BMW | 60 | 4 | 83 |
| Aluminium Metallic | Mazda | 140 | 2 | 63 |
| Amarant Violett | Porsche | 267 | 58 | 11 |

**HSV (Hue, Saturation, Value) tables**

**Part 3: HSV values of Real Car Paints**

Starts on page 20

- Tabulated HSV (hue, saturation, value) values for the Solid colour equivalent of the nominated Real Car paint.
- Paint names are listed in alphabetic order.
- If, for what ever reason, you desire to know the associated RGB (red, green, blue) values for these vehicle paints, then such values are provided for most of the pant samples in Part 4 of the document.

**Solid Paint Samples**

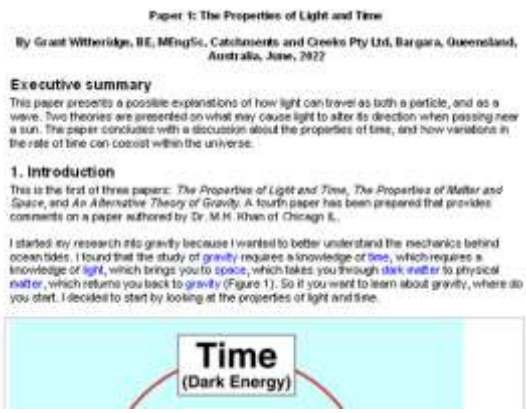
**Part 4: Solid Paint Samples**

Starts on page 48

- Paint colour samples are provided for the Solid colour equivalent of the nominated Real Car paint.
- Paint names are listed in the same order as they appear in Gran Turismo 7 (as of August, 2022).
- Colour samples are not provided for most of the Real Car Paints that cover the range black–grey–silver–off-white–white; instead, the HSV (RGB) values are tabulated.

## Introduction (prepared by G. Witheridge, Bargara, Queensland, Australia)

**Entering into the Unknown!**



Paper 1: The Properties of Light and Time

By Grant Witheridge, BE, MEngSc, Catchments and Creeks Pty Ltd, Bargara, Queensland, Australia, June, 2022

Executive summary

This paper presents a possible explanations of how light can travel as both a particle, and as a wave. Two theories are presented on what may cause light to alter its direction when passing near a sun. The paper concludes with a discussion about the properties of time, and how variations in the rate of time can coexist within the universe.

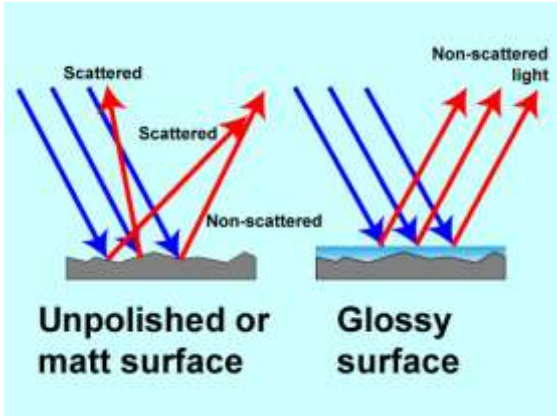
1. Introduction

This is the first of three papers: *The Properties of Light and Time*, *The Properties of Matter and Space*, and *An Alternative Theory of Gravity*. A fourth paper has been prepared that provides comments on a paper authored by Dr. M.H. Khan of Chicago IL.

I started my research into gravity because I wanted to better understand the mechanics behind ocean tides. I found that the study of gravity requires a knowledge of time, which requires a knowledge of light, which brings you to space, which takes you through dark matter to physical matter, which returns you back to gravity (Figure 1). So if you want to learn about gravity, where do you start. I decided to start by looking at the properties of light and time.

**The author's paper on Light and Time**

**Light reflection off a chrome surface**



**Light reflection off matt & glossy surfaces**

### Admission!

- I am NOT a trained Colour Consultant.
- The following information has been provided to help the many Gran Turismo car livery junkies that wish to:
  - apply a decal 'patch' to a car, and
  - apply a colour to that patch that best matches the underlying car paint.
- The HSV values supplied are NOT 'official', and are only a 'best guess' based on a simple PhotoShop analysis of the colour samples provided within GT7.

### What is colour?

- It may surprise you that 'colour' does not exist within the world!
- In fact, the whole Universe exists without both 'light' and 'colour'.
- However, what does exist is lots of 'electromagnetic radiation'.
- It is only within the brain or sensors of living creatures that the detection of this radiation is subsequently converted into a 'signal' we register as colour and light (the author has written papers on this topic).

### Paint sheen

- Sheen is a measure of how light is reflected off a surface.
- The reflection of light, which is a special characteristic of various paint finishes, such as chrome, metallic and pearl, cannot be generated solely through the hue, saturation, and value (HSV) settings.
- Gran Turismo 7 generates the appearance of these surface finishes by altering how 'light' is reflected off the surface of the car, hence the difference between actual chrome, and a paint called 'chrome'.

### Paint finish

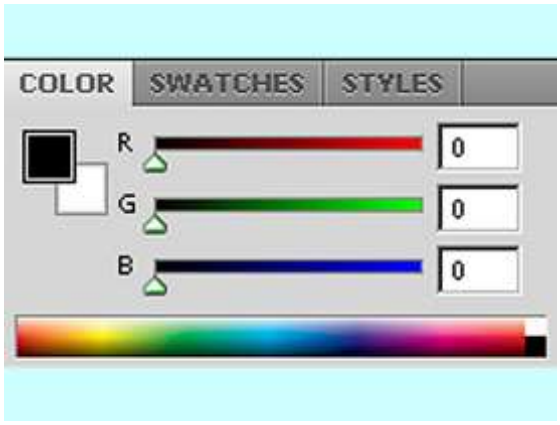
- Flat surfaces reflect almost all approaching light in a random direction.
- Matt surfaces reflect less than 10% of the light in a non-scattered manner.
- Eggshell reflects around 10 to 15%.
- Sheen reflects around 15 to 25%.
- Satin reflects around 25 to 40%.
- Semi-gloss reflects around 40 to 70%.
- High-gloss reflects around 70 to 90%.
- Chrome/mirror surfaces can reflect up to 100% of the light in a controlled direction.

## Colour coding

**Colour wheel – Basis of HSV System**

### HSV Colour Wheel

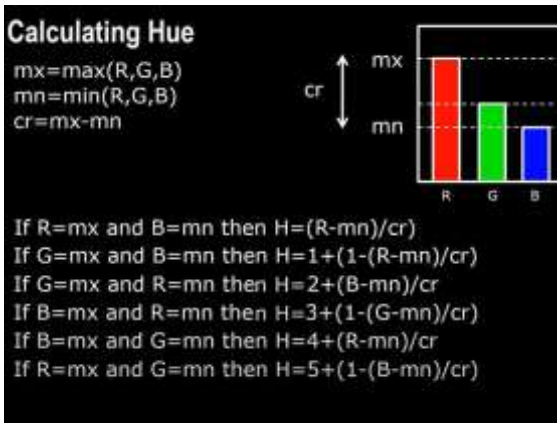
- HSV (hue, saturation, value) is an alternative to the RGB colour system.
- The HSV system was designed by graphic artists searching for a colour system that more closely aligned with the way human vision perceives colours.
- For those of us without Arts training, or a good eye for adjusting paint colours, the HSV system seems easier than RGB.
- Note: In HSV system, H = 0° is the same as H = 360°.



**PhotoShop RGB adjustment window**

### RGB Colour System

- RGB means: Red, Green, Blue.
- The RGB colour system is primarily used in the display of electronic images, such as seen on televisions and computers.
- RGB colours are not standard across all devices, consequently visual differences will occur from device to device, as can be observed in a typical TV sales room.
- In electronic devices, the colour 'black' is achieved by turning off the three colours; however, in 'printing', the colour black (K) needs to be added, hence: **CMYK**.



**Also try: easyrgb.com/en/**

### RGB to HSV conversion (one method!)

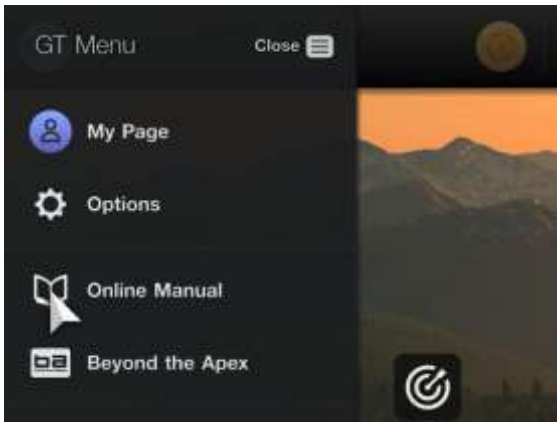
- R* = R/255, G* = G/255, B* = B/255
- $C_{max}$ = Maximum of ( R*, G*, B*)
- $C_{min}$ = Minimum of ( R*, G*, B*)
- $\Delta = C_{max} - C_{min}$
- If $\Delta = 0$, then let H = 0
- If $C_{max}$ = R*, then, H = 60[((G*-B*)/$\Delta$)mod6]
- If $C_{max}$ = G*, then, H = 60[((B*-R*)/$\Delta$)+2]
- If $C_{max}$ = B*, then, H = 60[((R*-G*)/$\Delta$)+4]
- If $C_{max}$ = 0, then S = 0; otherwise (below)
- S = ($\Delta/C_{max}$); and V = $C_{max}$ in all cases.

**Decal texture options**

### Colour finishes offered in GT7

- Surface textures for decals include:
  - glossy
  - semi-glossy
  - matte (matt)
  - powder.
- **Metallic body paints** simulate the reflection of aluminium flakes mixed into the paint.
- **Pearl body paints** simulate the reflection of mica powder mixed into the paint.

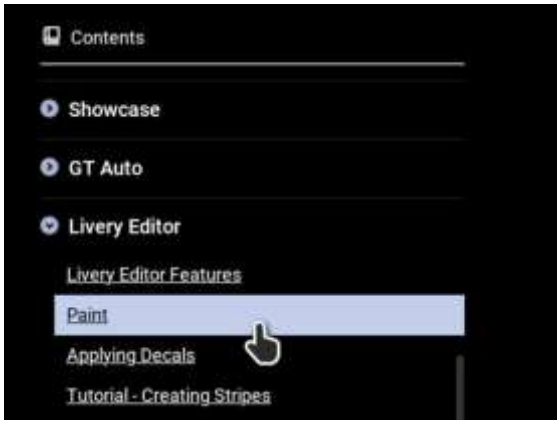
## GT7 Online Manual (further explained)



**Online Manual**

**GT7 Online Manual**

- Gran Turismo 7 incorporates an Online Manual.



**Paint**

**Online Manual guide to applying paints to cars**

- Information on the application of 'paints' is provided within the 'Livery Editor' section of this Online Manual.

**'Real Car Paint'**

**Purchase of 'Special Colours'**

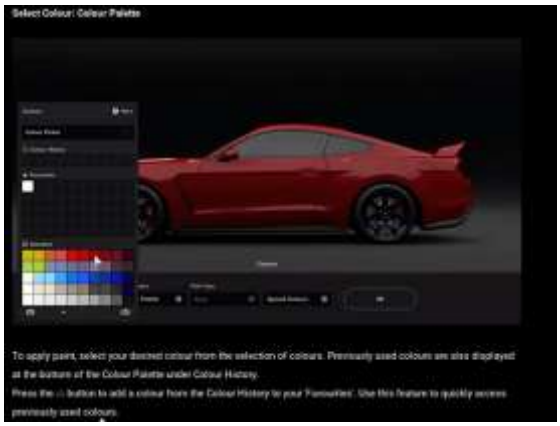
- Various categories of paint colour exist under the heading 'Special Colours', including:
  - Real Car Paint
  - Flakes
  - Dark Flakes
  - Matte Metallic, etc.
- This document focuses on just the first group of paints, which is titled **Real Car Paint**.

**Application of vehicle paint**

**Application of a Base Colour to a vehicle**

- A purchased paint colour can be applied to the whole, or selected parts, of a vehicle within the Livery Editor.

# GT7 Applying colours to a car



**Colour Palette**

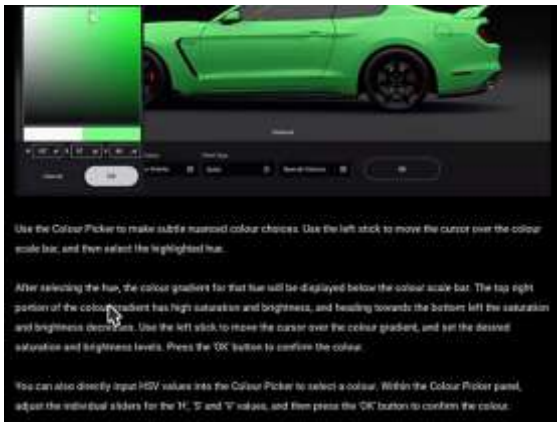
### Application of standard paint colours

- Paint colours can also be applied to vehicles via the free ‘Colour Palette’ option (i.e. avoiding the need to purchase a particular paint colour).

**Colour Picker**

### Colour Picker

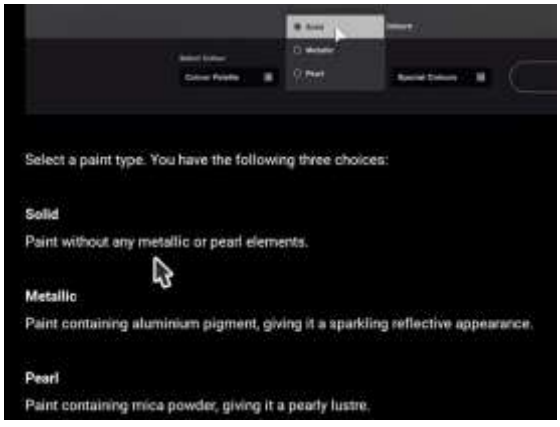
- Within the ‘Colour Palette’ there is the option to:
  - alter the colour of a selected ‘Standard’ colour using the HSV system; or
  - create a unique Solid colour using the HSV (Hue, Saturation, Value) system.
- If you are looking for a ‘silver’ or ‘chrome’, then you have a problem— silvers and chromes achieve their visual appearance in GT7 by ‘reflecting’ light, or the colours of surrounding objects, this is a computer-generated effect, not a paint effect.



**Application of HSV colour settings**

### HSV colour codes

- The HSV colour codes provided in this document are only applicable to Solid colour paints.
- If you are in the process of applying a base colour to a vehicle, then GT7 does provide the option of making this colour a Solid, Metallic, or Pearl effect (see below).
- However, if you are trying to apply colour to a ‘decal’ (or patch), then the option of making the paint metallic or pearl does not currently (2022) exist.



**Select the type of paint**

### Paint finish options

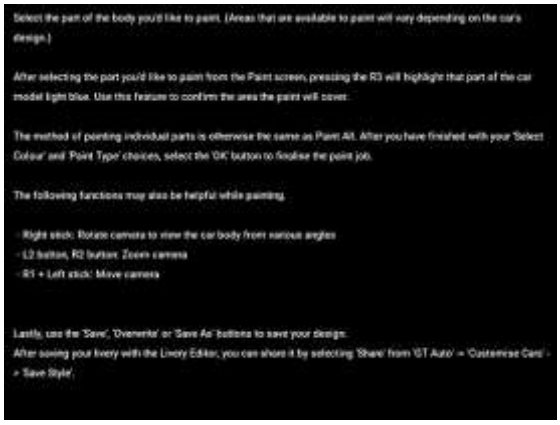
- Car paints can be applied in three forms: Solid, Metallic and Pearl.
- **Solid paints** are the best to work with if you are planning a complex car livery with many decals.
- **Metallic paints** aim to simulate the reflection of aluminium flakes mixed into the paint—this makes it impossible to match the paint colour using HSV codes.
- **Pearl (pearlescent) paints** aim to simulate that addition of mica powder into the paint, which gives the paint ‘depth’.

# GT7 Applying decals to a car

Applying paint to a car

### Applying paint to a car

- Initially the paint colour will be applied to the whole of the vehicle.
- Following this, the option will exist for different paint colours to be applied to various sections of the car:
  - Body
  - Body 2 (usually the bonnet/hood)
  - Side Mirrors
  - Rear Wing
  - Other.



Further instructions

### Use of Hand Controller

- The Online Manual provides information on how to view what parts of the car the paint colour can be applied to.
- It is much easier to do all of these car livery functions using a Hand Controller, rather than a Steering Wheel controller.

Decals

### Applying decals

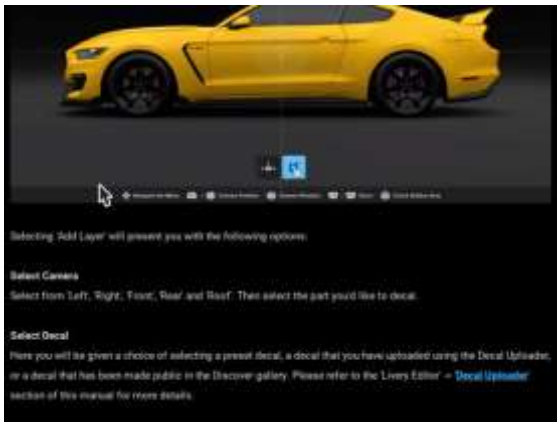
- The option to apply decals to a car exists within the ‘Livery Editor’ section.

Location of decals

### Choosing where decals are placed

- Firstly, choose the location where the decal is to be placed (Body, Body 2, Side Mirrors, Windows, Windscreen, Other).
- Secondly, select ‘Add Layer’ (shown in the lower right-hand corner).
- Thirdly, prior to selecting your decal, use the Hand Controller functions to zoom, rotate, or move to the location where you would like to place the decal—important to get this right because the screen will always return to this position whenever this decal is selected in the future.

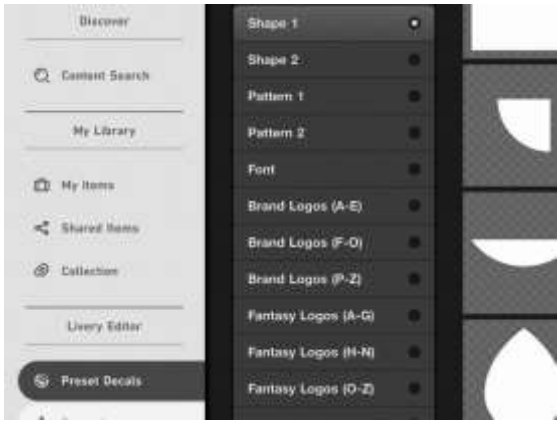
# GT7 Applying decals to a car



Camera position

## Positioning the ‘camera’

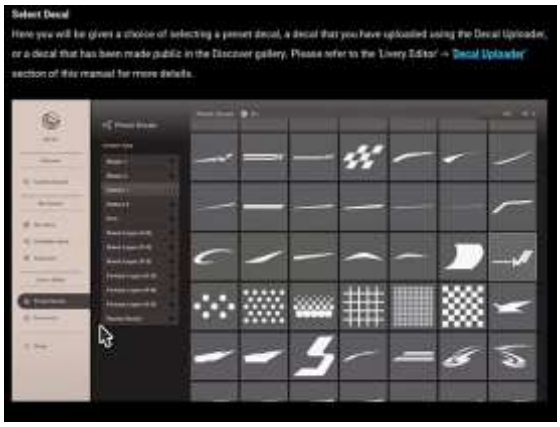
- If you place a decal on the car, then move the decal to a new location (which may require you to move the viewing screen to a new location), then:
  - if you select that decal some time in the future in order to do further editing, the camera view will return to the original viewing window (i.e. where the decal was first applied to the vehicle)
  - this can become annoying after a while, so it is best to reposition the camera every time a new decal is applied.



Preset Decals

## Preset Decals

- Numerous decals are provided as standard within GT7.
- Many common company logos can be found in the folders:
  - Brand Logos (A-E)
  - Brand Logos (F-O), etc.
- Otherwise, you can create up to 10 Favourites folders, in which you can store up to 100 decals per folder.



Standard Patterns

## Standard Patterns

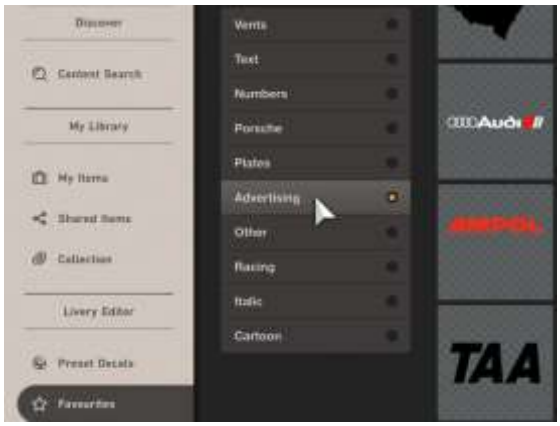
- Many of the standard racing car decals (e.g. GT-stripes) are available within the Preset Decals folder.

Favourites

## Favourites Folders

- To create a Favourites folder, you need to be in the Decals selection window.
- The image (left) does not show the option to Create a Favourites folder because I had already created my maximum of 10 folders.

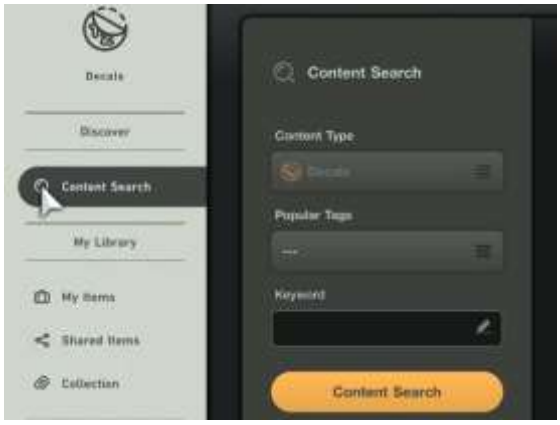
# GT7 Downloading and storing decals



**My named Favourites folders**

## Naming your Favourites folders

- Here I have named my Favourites folders as: *Vents* (as in air vents), *Text, Numbers, Porsche, Plates* (car Registration plates), *Advertising, Other, Racing, Italic, Cartoon.*
- Think carefully about your folder names so that you don't end up with one folder filled with decals and unable to accept any more, while other folders are near-empty.
- (If I were smart, I should have placed my italic text in with the rest of the text, and then had two folders labelled Logos A-M and Logos N-Z).



**Searching for a decal**

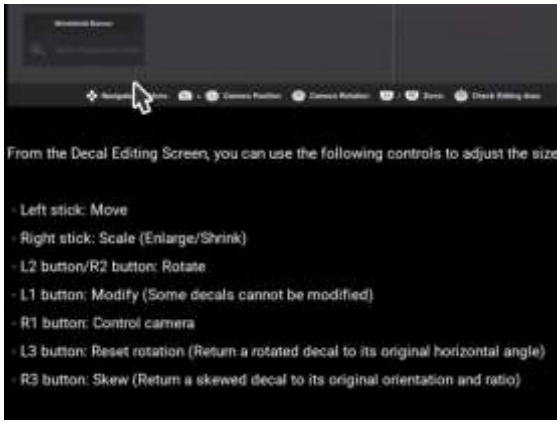
## Downloading decals

- Decals created by other Gamers can be found through the Content Search process.
- While you are in the Decals window, the Content search will automatically default to searching for Decals.
- With regards to common advertising logos, don't forget about all the logos already available within the Preset Decals.

**Placing a decal in a Favourites folder**

## Placing decals in your Favourites folders

- In order to place a Decal into one of your Favourites folders:
  - find the decal you are interested in keeping
  - press the PlayStation triangle (Δ)
  - choose: Add to Favourites.
- This option of placing decals into your Favourites folders is not currently (August, 2022) available while you are in the Showcase (i.e. Magnifying glass) window attached to the GT7 Home Page.

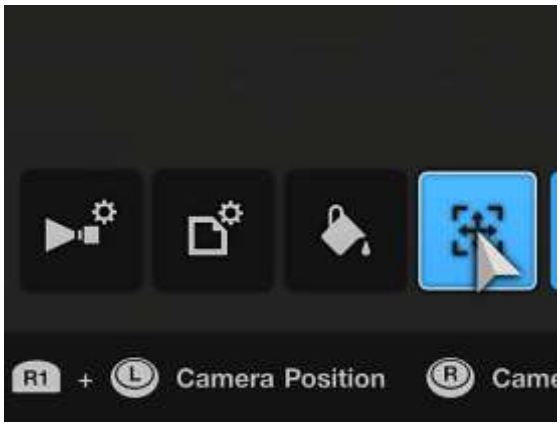


**Positioning a decal**

## Modifying a decal

- The Online Manual provides information on how to use the Hand Controller to alter the position, rotation, size and application method for decals.
- Hint: Pressing the Play Station square (☐) button while activating another button will, in some cases, slow the function of the other button—this means you can use this function (along with the up/down, left/right buttons) to move a decal in smaller steps.

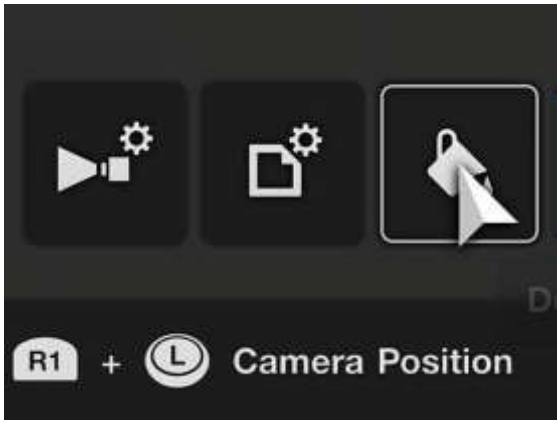
## GT7 Modifying decals



**Decal modification**

### Final adjustments to a decal

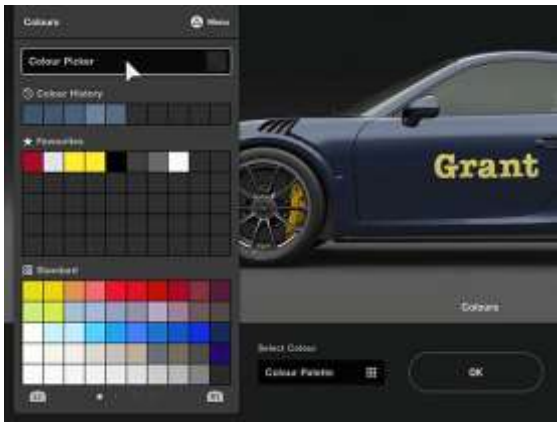
- After a decal has been placed, several functions exist that can be used to alter the appearance of the decal.



**Painting decals**

### Change the colour of a decal

- The colour of a decal can be changed.
- Depending on how the decal was developed, this colouration process may apply to all of the decal (even the black bits), or only to a part of the decal.
- Duplicating a decal and then painting the underlying decal black, white, or other colour, will give you one method of introducing shadow to a decal.



**Colour options**

### Decal colour options

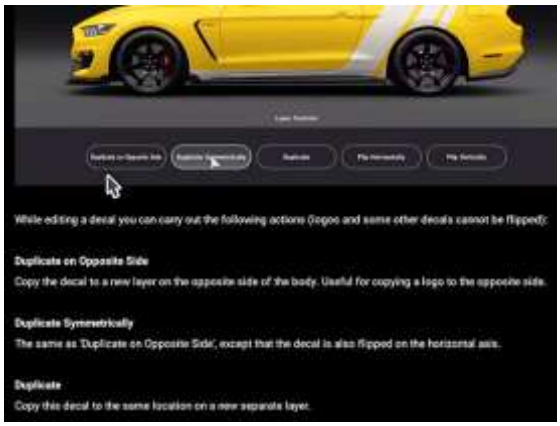
- Decals can be painted with:
  - Colour Picker, using HSV values
  - Colour History, using the colour previously used on the car
  - Favourites, using colours that you select as Favourites because you use them frequently
  - Standard solid colours.
- The option does not currently (Aug ’22) exist to apply Special (purchased) Colours to decals.

**Duplication & flipping decals**

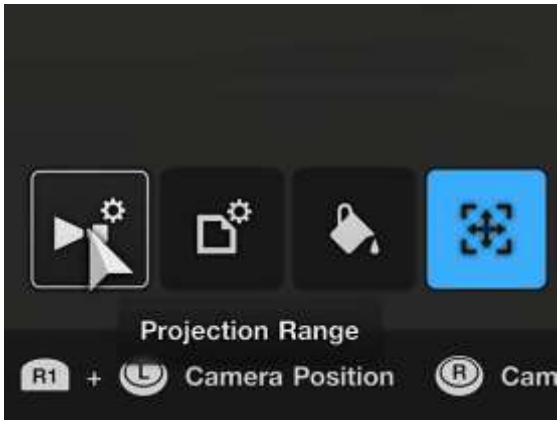
### Duplication of decals

- This function allows you to:
  - Duplicate on Opposite Side: when working on the general car body, this places the decal on the opposite side of the car
  - Duplicate Symmetrically: if the decal is tilted, then this is usually the best option
  - Duplicate: duplicates the decal in its current position
  - Flip Horizontally (see below)
  - Flip Vertically (see below).

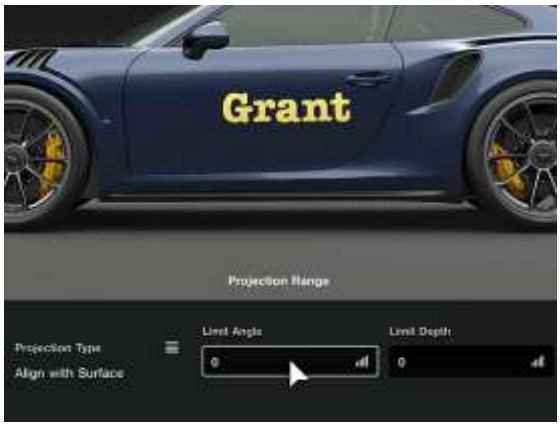
# GT7 Modifying decals



**Flipping decals**



**Projection Range**



**Controlling decal 'depth' effects**

**Decal layer options**

### Two types of decal application

- Flipping a decal horizontally or vertically can sometimes result in the decal not appearing to change its alignment or position in either case.
- **Note 1:** What is considered 'Horizontal' and what is considered 'Vertical' relate to the original alignment of the decal, i.e. before you started rotating it manually.
- **Note 2:** When you are working on Body 2 or Other body parts, the 'opposite' side of the bonnet (hood) is the other side of the bonnet, not the boot or trunk!

### Projection effects

- Projection effects include:
  - Projection Type: Align with Surface
  - Projection Type: Align with Camera. This option is very good when you are duplicating a decal several times and you want to join these decals side by side on a curved body part. Also good for placing a colour around a headlight.
  - Limit Angle: (see discussion below)
  - Limit Depth: (see discussion below).

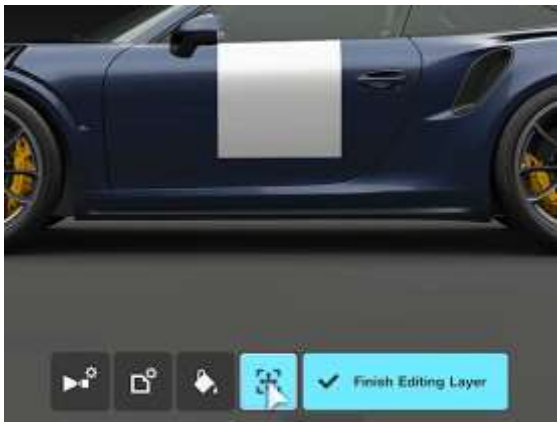
### Limit Angle and Limit Depth

- These two adjustment settings can be confusing—I find 'trial and error' often works best here!
- **Limit Angle:** this option is good for making sure a decal wraps around the edge of a body part, such as a door.
- **Limit Depth:** this option is good for adjusting how far a decal will extend as it wraps around the front or end of a vehicle—it also can be used to stop a decal 'bleeding' through to the other side of a rear wing or spoiler.

### Adjusting the order of decal layers

- You can alter the layering of decals by:
  - click on the decal you are interested in
  - press the PlayStation triangle (Δ)
  - this should bring up a Drop-down Menu, which has several options.
- Choose: 'Move Layer', then use your up/down arrow buttons to move the decal to a new layer position.

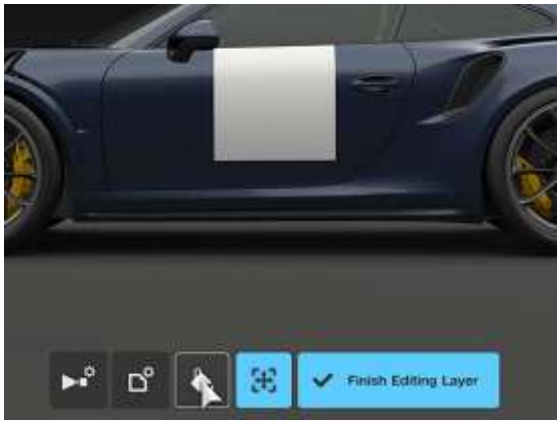
## Hints on adjusting HSV values on a decal or ‘patch’



**Decal placed on car**

### Introduction

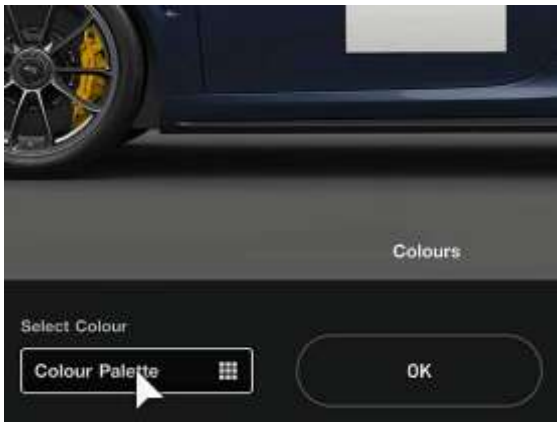
- The original purpose of this document was to:
  - tabulate the HSV values that are a close approximation of the Real Car Paints found in GT7
  - help Gamers use these HSV settings to colour decals and patches.
- This discussion will begin with the assumption that you have already selected and placed a decal or patch on a vehicle.



**Colour application button**

### Colour the decal

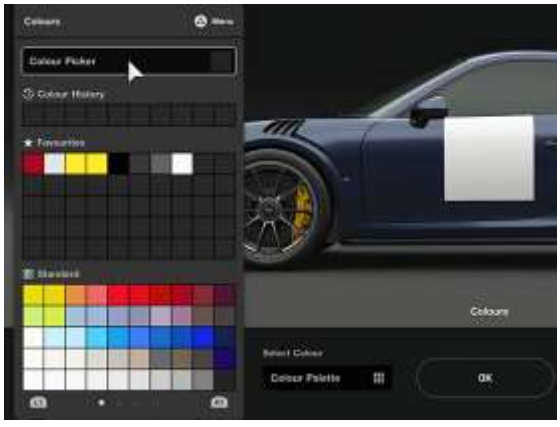
- Select the tipping paint bucket.



**Colour Palette**

### Colour Palette

- Choose the Colour Palette option.



**Colour Picker**

### Colour Picker

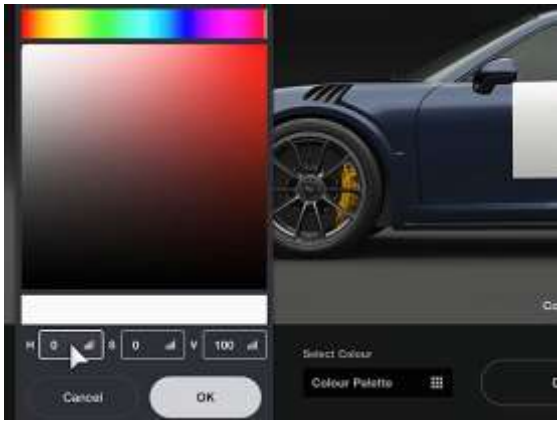
- Choose the Colour Picker option.

## Hints on adjusting HSV values on a decal or ‘patch’

**Colour Picker**

### Obtain the desired HSV settings

- HSV values can be obtained from two locations within this document:
  - the tabulated colour chart data that lists all the Real Car Paints in alphabetical order (Note that more than one car manufacturer may use a particular paint name)
  - the colour samples presented at the end of this document that list the Real Car Paints in the same order they appear in GT7 (as of August, 2022).



**Manually enter the HSV values**

### Manually enter the initial HSV values

- Manually enter the HSV values.
- In this example we are dealing with Porsche colour: ‘Pazifikblau Metallic’.
- From the HSV table (presented a few pages further into this document) we obtain the HSV values of: 217, 38, 30.

**Entering the ‘hue’ value**

### HSV values

- Hue values can vary from 0-degrees to 360-degrees.
- In the ‘hue’ settings, 0-degrees is equal to 360-degrees.
- This means colours with low hue values will look similar to colours with high hue values (i.e. close to 360-degrees).
- Saturation values vary from 0 to 100.
- Value settings also vary from 0 to 100.

**Initial HSV values**

### Initial HSV settings

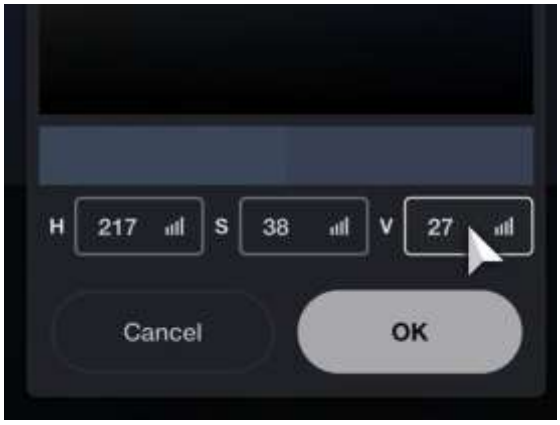
- The HSV values presented within this document should be considered a first approximation.

## Hints on adjusting HSV values on a decal or ‘patch’

**Colour not perfect**

**This colour is not a perfect match!**

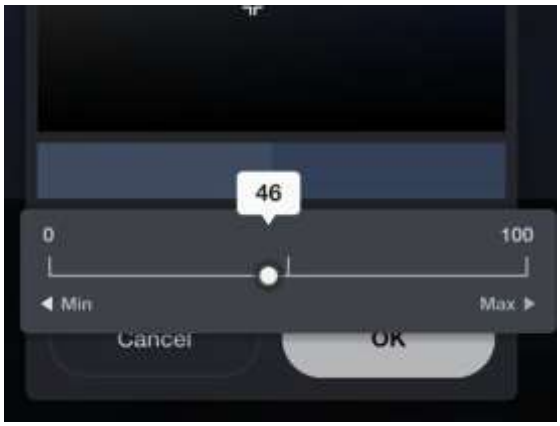
- We know (because we have read the previous pages) that these initial HSV settings will not be a perfect match to this Porsche Factory colour because it is a metallic paint.



**Adjustment of the ‘Value’ setting**

**Adjusting the HSV settings**

- From experience I found it better to first adjust the ‘Value’ setting.
- You are looking to get the right degree of ‘shading’ (i.e. lightness or darkness).



**Adjustment of the ‘Saturation’ setting**

**Adjustment of the Saturation setting**

- The next step should be to adjust the ‘Saturation’ setting.
- Here you are looking to get the right intensity or richness of colour.

**Adjustment of the ‘Hue’ setting**

**Adjust the Hue setting**

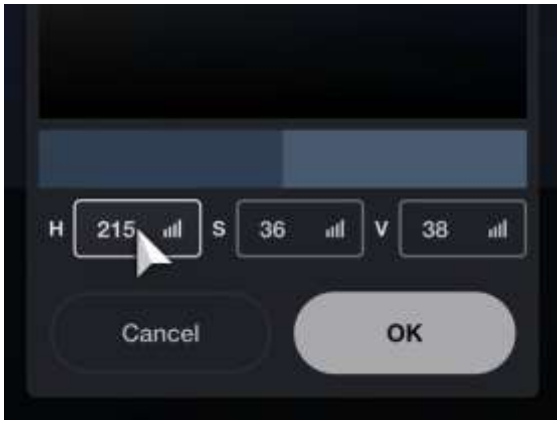
- Finally you adjust the ‘Hue’ setting to try and get the best colour match.

## Hints on adjusting HSV values on a decal or ‘patch’

**Adjusted colour**

- In this example I tried to match the colour of the decal patch with the car paint near the lower right hand side of the patch.

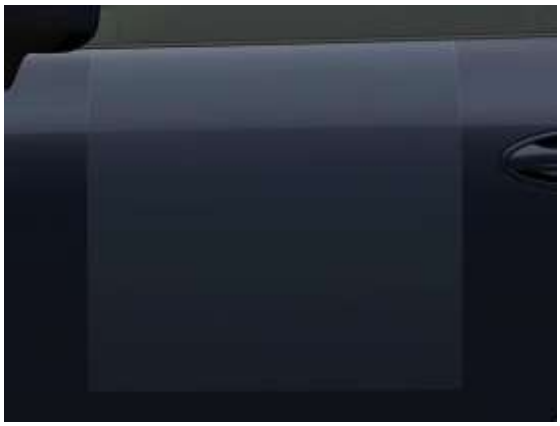
**Adjusted colour**



**Trying to match the colour on the upper portion of the patch**

- If I were to try and match the upper section of the patch (i.e. the area where the car has less shading and a greater reflection of sunlight), then I get HSV values of: H = 215, S = 36, V = 38.

**Further revision of the HSV setting**



**Trying to match the upper portion of the ‘patch’**

- The upper portion of the patch is still not a perfect match for the underlying paintwork.

**Further revision of the HSV setting**

**Still not good enough!**

- This example of colour adjustment demonstrates how hard it can be to place a large ‘invisible’ patch onto a car that has metallic or pearl-effect paint.
- Better results would have been achieved if the car was repainted using a Solid colour.

**A perfect colour match not achieved**

## Simulation of a textured/fabric/vinyl roof cover

Work area and decal settings

### Generating the appearance of fabric or vinyl roof/cover

- In general, Gamers decorate cars for two reasons:
  - they wish to reproduce the appearance of a car known to them, such as a famous race car
  - they wish to reproduce a car previously owned by themselves, a family member, or friend.
- Of course there are those 'artistic' people that develop car liveries just for fun.

Decal texture

### Reproducing a 'soft top'

- A textured roof can form part of a:
  - soft top, or cabriolet
  - Targa-type removable roof
  - canvas roof on a VW Sambabus.
- Textured surfaces can be reproduced by using the Decal Texture function.
- A 'painted' roof can be generated by applying a standard decal patch to the roof, then applying a colour to this patch.

Decal texture options

### Texture options

- The decal textures include:
  - Glossy Decals
  - Semi-Glossy Decals
  - Matte Decals
  - **Powder Decals.**
- Unfortunately, choosing any of these texture options will mean that this same texture will be applied to all the decals, not just the vehicle roof.

Simulation of 'stitching'

### Applying the effect of 'stitching'

- This red fabric is generated using HSV values of: H = 353, S = 100, V = 42.
- Fabric stitching can be applied as:
  - a decal
  - appropriately-coloured 'textured' patches obtained from the Preset Decals.
- Congratulations to Tobi_K73 for the exceptional work on this Chevy Nova.

## Useful hints

**Enhancing the colour by duplication**

### Overlapping decals

- When some decals are applied to a car they can appear far less colourful than they did when they had a solid white or black background.
- In some cases you can enhance the appearance of a decal by:
  - simply duplicating the decal in its current position two or three times
  - duplicating the decal, then rotating the underlying decal 1-degree
  - adding a black or white shadow.

**Examples of black shadows**

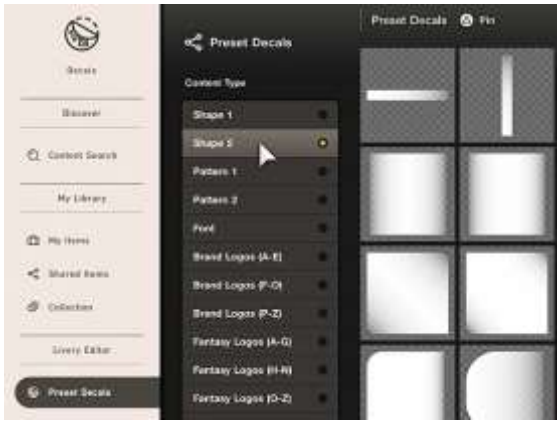
### Shadow effects

- Shadow effects can be generated by:
  - duplicating the decal
  - painting the underlying decal black
  - moving this underlying decal one or two clicks down, and to the right.
- For the 'Stop' sign (left) the black outer line was produced by duplicating the decal, painting the underlying decal black, then expanding the horizontal and vertical scale of the underlying decal.

**Colour transition on a car body**

### Fading from one colour to another

- A two-tone car can be produced by:
  - painting the car one of the two colours (usually the colour you want to make metallic or pearl)
  - applying a rectangular decal patch to the roof using a 'Shape 2' patch
  - extending the depth of this decal using the 'Limit Depth' function (set to 10)
  - applying your second colour to this decal
  - applying a chosen texture to this decal.



**Standard shapes with fading effects**

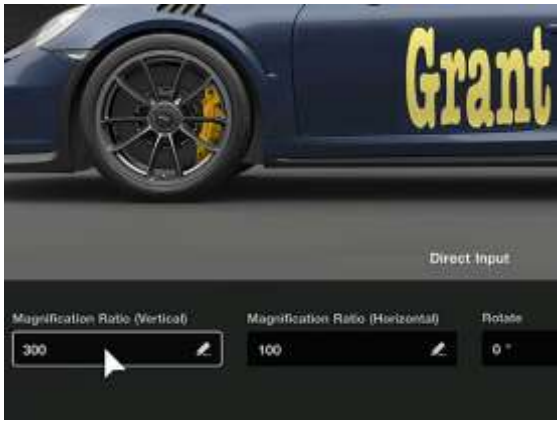
### 'Shape 2' decals

- Within the Preset Decals is a folder titled: 'Shape 2', which contains similar decal patches as in folder 'Shape 1', but with fading effects introduced to the decals.
- These decals can be used to produce the two-tone effect discussed above.
- These decals can also be used to:
  - simulate round objects / tubes / pipes
  - simulate the effect of fabric stretched over a Convertible frame
  - simulate shadows on body panels.

## Useful hints

**Step 1: Click on this 'button'**

**Step 2: Now press the PlayStation (Δ)**



**Step 3: The triangle opens these options**

### Expansion and rotation of decals

- The PlayStation triangle **(Δ)** opens the following options:
  - Magnification Ratio (Vertical)
  - Magnification Ratio (Horizontal)
  - Rotation
  - Opacity.
- Altering the vertical scale can be useful when getting all text to be the same size, or fitting narrow text to registration plates, or windscreen banners.

**Rotation of decals**

### Adjusting decal rotation

- You can rotate a decal an exact amount—this is useful when placing text, letter-by-letter on a slope, or just rotating a decal 90-degrees, etc.
- If you accidentally rotate a decal by pressing the Hand Controller's L2 or R2 triggers by mistake, then you can:
  - return the decal back to 0-degrees using this function, or
  - pressing the PlayStation circle (O) while still within decal edit mode.

**Layering decals on top of each other**

### Adjusting opacity

- Adjusting the opacity of a decal can be useful if you wish to:
  - overlap decals without one particular decal dominating over the rest (e.g. adding rain, clouds and lightning)
  - giving decals the appearance of 'depth' (this does not always work!)
  - giving paint the appearance of depth—this usually requires one colour with 10% to 50% opacity being placed over another solid colour—often a darker colour (difficult to get right!).

## GT7 Real Car Paint (listed alphabetically)

Listed below are all the Real Car Paints, listed alphabetically, with a best estimate of the HSV values for the equivalent Solid paint colour.

The HSV values will need to be refined through minor adjustment of the Hue, Saturation and Value parameters until a perfect colour match is achieved.

The tabulated HSV values are appropriate for 'Solid' colours. If the Real Car Paint is a Metallic or Pearl, then the HSV values should be taken as a first approximation. It is most unlikely that a perfect colour match will be achieved using only HSV adjustments if your desire is to match a Metallic or Pearl-effect factory paint.

| | | Equivalent Solid Colour | | |
|---|---|---|---|---|
| **Real Car Paint** | **Manufacturer** | **H** | **S** | **V** |
| Abarth 1500 Biposto Bertone Grey | Abarth | 192 | 14 | 73 |
| Abarth 595 Esseesse White | Abarth | 42 | 5 | 84 |
| Acid Blue | RUF | 217 | 79 | 89 |
| Active Green | Infiniti | 179 | 80 | 44 |
| Active Red | Nissan | 359 | 87 | 79 |
| Admiral Grey Metallic | Honda | 0 | 0 | 60 |
| Adrenaline Red | Dodge | 1 | 96 | 88 |
| Aetna Blau | Porsche | 216 | 37 | 35 |
| Agave | BMW | 175 | 81 | 35 |
| Alabasrer Silver Metallic | Honda | 150 | 2 | 72 |
| Alfa Red | Alfa Romeo | 0 | 85 | 77 |
| Alfa White | Genesis | 36 | 2 | 84 |
| Almond Beige Metallic | Audi | 38 | 22 | 73 |
| Almond Green | Mini | 2 | 57 | 27 |
| Alpine Green Metallic | TVR | 45 | 16 | 75 |

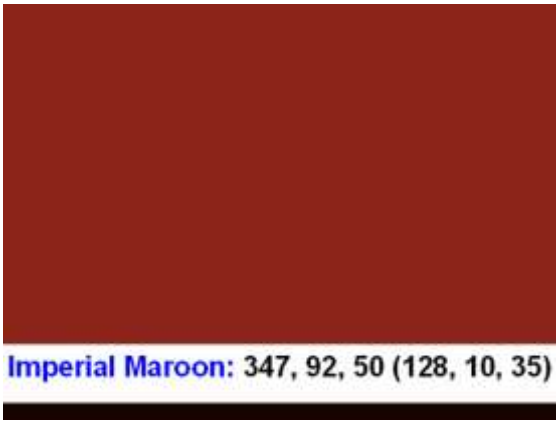
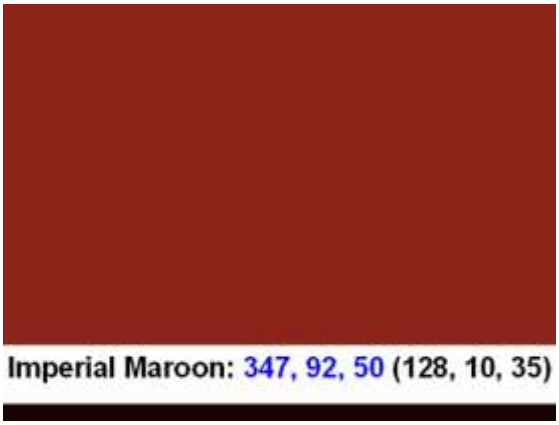
**Jet Black:  HSV = 0, 0, 0  (RGB 0,0,0)**

## An Explanation of The Following Colour Samples

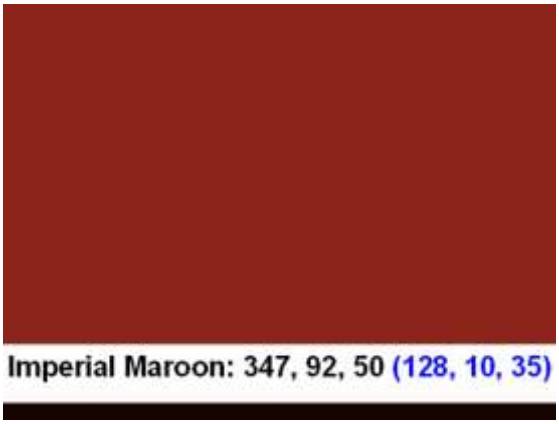
**Please take note**



**Factory paint name**



**HSV values** (for the equivalent Solid paint)



**RGB values** (not always provided)

**Are you paying attention?**

- For those of you that refuse to read any or all the previous explanatory notes, I will make one last attempt to explain what these colour sample and colour codes actually represent.
- PLEASE don't contact me and tell me that these colour samples don't match the Real Factory Colours, or that the HSV values don't reproduce metallic or pearl effects; otherwise I will be forced to seek you out with my Dr Nefario-designed 'Fart Gun' and make your life a living hell!

**Colour samples**

- The following colour samples represent the best Solid colour reproduction of the specified (named) Real Factory Paint.
- If the Real Factory Paint is a metallic or pearl-effect colour, then the colour sample (which is a Solid colour) may not be a good match for the original factory colour.
- This means that the 'Factory Paint Name' may not actually apply to the provided paint sample, but instead to a metallic or pearl alternative of this 'solid' paint.

**HSV values**

- The HSV (hue, saturation and value) parameters provided below the colour samples relate to the displayed colour sample, not to the Real Factory Paint.
- These HSV parameters can be used as a starting point as you attempt to adjust the colour of a patch or decal to match your car's colour.
- Hue has a range of 0° to 360°
- Saturation has a range of 0 to 100
- Value has a range of 0 to 100

**RGB values (in brackets)**

- The RGB (red, green, blue) parameters have been generated via a direct conversion of the colour samples provided in GT7 into RGB (range of 0 to 255).
- The colour samples were then generated in PhotoShop using the RGB values presented in the brackets.
- In a perfect world, the RGB and HSV values would reproduce the same colour; however, within GT7, paint colours can be altered through the process of simulating the reflection of light on a car body.

## Real Car Paint Samples – Paint Name: H, S, V  (R, G, B)

**Magenta: HSV = 331, 64, 99 (253, 92, 171)**

**Strawberry: HSV = 348, 71, 99 (252, 73, 108)**

**Moulin Rouge: 341, 81, 96 (245, 47, 109)**

**Sternrubin: HSV = 337, 87, 69 (177, 23, 81)**

**Imperial Maroon: 347, 92, 50 (128, 10, 35)**

**Rosso Barchetta: 346, 93, 56 (142, 10, 41)**

**Claret: HSV = 358, 93, 12 (30, 2, 3)**

**Vinaccia: HSV = 351, 68, 12 (31, 10, 13)**

**Bariloche Brown: 8, 63, 20 (51, 23, 19)**

**Grand Prix Maroon: 356, 85, 18 (47, 7, 10)**

## Real Car Paint Samples – Dark Maroon

**Royal Maroon: 348, 91, 27 (68, 6, 18)**

**Borderux: HSV = 358, 94, 27 (70, 4, 6)**

**Deep Burnt Orange Met: 2, 88, 29 (73, 11, 9)**

**Bordeaux Pontevecchio: HSV = 359, 92, 29**

**Rosso Rubino: 347, 87, 33 (85, 11, 27)**

**Amaranto Bull Lea: 354, 89, 25 (65, 7, 13)**

**Arena Rot Metallic: 354, 75, 25 (65, 16, 21)**

**Citron Mist Metallic: 4, 24, 25 (63, 49, 48)**

**Cherry Black Pearl Effect: 351, 42, 26**

**Rosewood Metallic: 356, 51, 25 (63, 31, 33)**

## Real Car Paint Samples – Brown

**Deep Red Metallic: 355, 66, 27 (70, 24, 28)**

**Kutani Red Pearl: 351, 78, 31 (80, 18, 27)**

**Polyanthrot: HSV = 354, 77, 33 (84, 19, 25)**

**Rosso Metallizzato: 356, 73, 38 (96, 26, 31)**

**Rubino Micalizzato: 353, 77, 38 (97, 22, 31)**

**Diavolo Red: HSV = 357, 85, 38 (98, 15, 19)**

**Ruby Red: HSV = 356, 87, 35 (89, 12, 17)**

**Malaga HSV = 351, 92, 40 (101, 8, 22)**

**Amaranto Ferrari: 354, 94, 39 (99, 6, 15)**

**Garnet Red Mica: 359, 74, 41 (105, 27, 28)**

## Real Car Paint Samples – Crimson

**Rosso Metallizzato: 0, 93, 40 (102, 7, 7)**

**Rosso Sir Ivor: HSV = 1, 95, 44 (111, 7, 6)**

**Dubonnet: HSV = 358, 90, 49 (124, 13, 17)**

**Rosso Cordoba Met: 356, 93, 45 (114, 8, 15)**

**Red Pearl Metallic: 350, 91, 38 (96, 9, 23)**

**Dark Red Mica Metallic: HSV = 348, 91, 41**

**Starmist Crimson: 352, 90, 45 (115, 11, 25)**

**Passion Red Tricoat: HSV = 348, 91, 50**

**Dark Red Metallic: 350, 91, 49 (124, 11, 29)**

**Red: HSV = 350, 89, 58 (149, 16, 39)**

## Real Car Paint Samples – Dark Red

Light Red M: HSV = 354, 72, 60 (152, 43, 54)

Ember Mist: HSV = 350, 78, 63 (161, 36, 56)

Flowing Coral: HSV 359, 63, 65 (167, 62, 64)

Mars Red: HSV = 357, 84, 75 (190, 31, 40)

Formula Red Pearl: 348, 93, 65 (166, 12, 43)

Flame Red: HSV = 349, 92, 61 (155, 13, 38)

Cranberry Red: 355, 92, 50 (127, 10, 20)

Cavendish Red: 357, 88, 57 (146, 18, 24)

Melbourne Rot Metallic: 2, 94, 52 (133 12 8)

Long Beach Red Metallic Tintcoat: 3, 95, 48

## Real Car Paint Samples – Dark Red

## Real Car Paint Samples – Bright Red

**Technical Note:**

- It should be obvious by now that if you remove the Metallic and/or Pearl effects from a Factory paint, many of the tints begin to look identical even though each has different HSV colour settings.
- Even though the colour samples appear identical in these sample charts, the differences will be more obvious if the colours are applied to a vehicle due to the light reflection that occurs within GT7.

**86% Grey: 0, 0, 20 (50, 50, 50)**

**83% Grey: 0, 0, 24 (60, 60, 60)**

**80% Grey: 0, 0, 27 (70, 70, 70)**

**Real Car Paint – Black**

- There are approximately 150 different examples of black paint.
- In certain lights, some ‘blacks’ can reveal shades of an underlying colour, such as ‘Midnight Blue’ and ‘Sapphire Black’.
- Metallic and Pearl finishes can add depth to the colour; however, this effect cannot be reproduced within the HSV settings.

**Black & grey shades don’t like HSV!**

- The Hue-value is not an effective way to measure the black/grey scale.
- The various ‘black’ paints have been arranged based on their ‘greyscale’, which has been determined directly from the paint’s RGB colour coding.
- **Greyscale** = 100 x (1 - [(0.298 x **R**) + (0.587 x **G**) + (0.114 x **B**)]/255)

## Real Car Paint Samples – Black scale

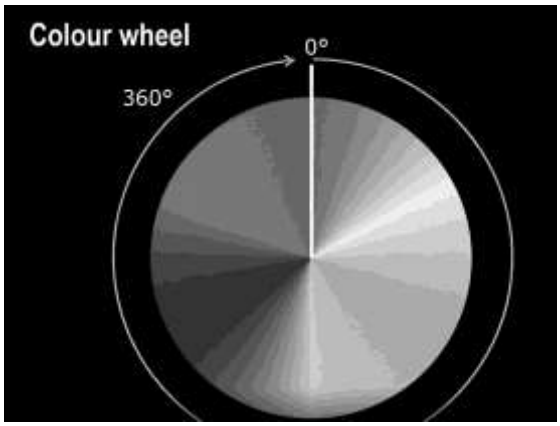
| Diamantweiss Metallic | Mercedes | 60 | 3 | 89 |
| Summit White | Chevrolet | 45 | 2 | 89 |
| Storm White | Nissan | 60 | 3 | 91 |

**Colour sample is based on an average of the RGB values: HSV = 60, 3, 89 (226 226 220)**

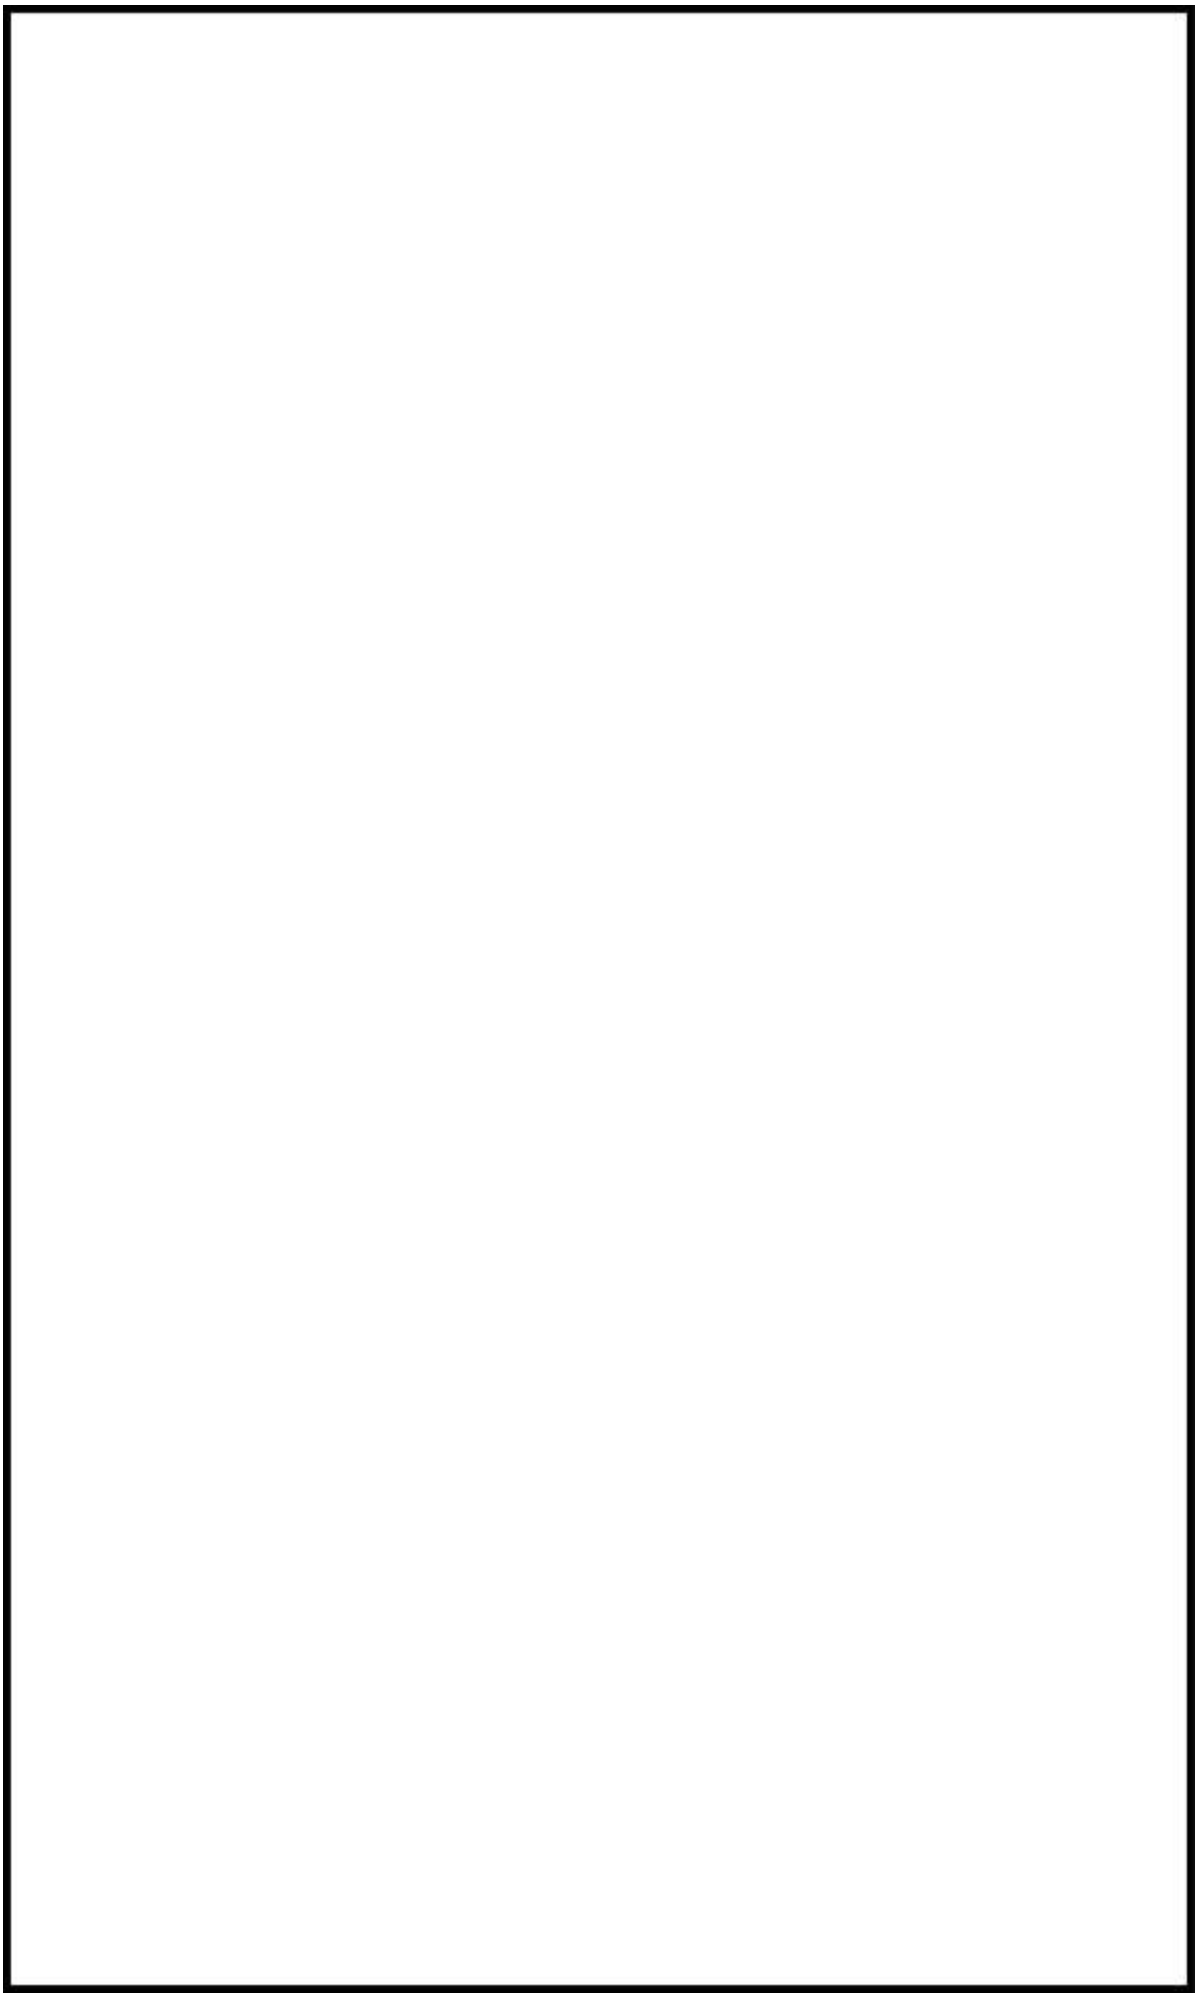
**Note: Pure white has values: HSV = 0, 0, 100 and (RGB = 255, 255, 255)**

**Colour wheel – Basis of HSV System**



**A greyscale version of the colour wheel**

**Greyscale**

- It would appear that GT7 has primarily relied upon the Hue value when arranging the order of the various paint colours.
- Such a system works well for the majority of rainbow colours; however, the Hue value is not a reliable parameter when the paint colours move in the colour range that varies from black to white.
- As can be seen from the greyscale conversion of the Hue Colour Wheel, the same 'grey' can appear on both the left and right-hand sides of the colour wheel.
- This means that when you move into the black–grey–silver–white range of the colour wheel, there can be two paint colours that have an identical greyscale value, but one of these paints could have a low Hue value (HSV) while the other paint could have a high Hue value.
- To avoid this Hue-scale problem, once the paint colours progressed past 'Black', I have subsequently grouped the paint colours based on their greyscale, which I have determined directly (mathematically) from the paint's RGB colour coding.
- **Greyscale** = 100 x (1 - [(0.298 x **R**) + (0.587 x **G**) + (0.114 x **B**)]/255)


Finally; putting this document together has required a lot of hard, repetitive work. I sincerely hope that the resulting information will help GT7 Gamers to further enjoy this great game.
